Field of the Invention The present invention relates to a semiconductor device and method for fabricating the same, and more particularly, to a semiconductor device with a nonvolatile memory array capable of efficiently achieving a simplified fabrication process and an improved electric characteristic and method for fabricating the same. 2. Description of the Related Art In the field of semiconductor devices, various kinds of nonvolatile memory devices have been proposed in order to reduce a quantity of data to be stored. These memory devices are used in various ways for recording important data or storing program or game programs for example. Among the various nonvolatile memory devices, a flash memory device is particularly noted since it has a relatively high integration degree and a relatively high operation speed. Meanwhile, in the field of semiconductor memory devices, the high integration of the memory device has been
